

Goal: to outline the MVP for Wedding Recon, and relevant context, such that an AI agent can build the product, provide feedback/disagree, and make excellent design decision tradeoffs.

Overview: After hearing 7 engaged friends complain about not getting wedding venue quotes until they visit in person, and 4 friends told me they found their wedding band entirely off the recommendation of a friend, I decided it was time to build a solution: Wedding Recon, a central hub for engaged couples to benefit from local wedding vendor intel.

What is it: At a super high level, Wedding recon is a **mobile-first website** that delivers two key workflows:

- 1) Allows users to explore wedding vendors in a region, across venues/food/music/flowers/dresses/photography and other categories.
- 2) Allows users to save vendors of interest and log their own intel about vendors they visit, all in one central “planning hub”

Note that (2) is largely in service of (1). There is a fundamental marketplace challenge - and risk - around driving users to share intel on the platform. The hope is that by providing value to an individual user when they log their own intel - in the form of a central, organized “planning hub” - this will provide enough value to the user to get them to add their own intel, which will then become accessible to other users.

Similar products: Mtn Project for rock climbing routes, iOverlander for camping spots.

Requirements:

I’ll include proposals/ideas/mockups for how to accomplish the user requirements below, but I’d consider those soft suggestions, not hard requirements. We should feel encouraged to propose better/alternative ideas that align with the high level product goals and the user requirements.

Account Creation

As a fiancée, I can quickly create an account on Wedding Recon, which will allow me to store relevant Recon.

- *Suggestion:* we create authentication/account constructs with bare minimum information: phone number, email, and anonymous username.

Vendor Exploration

As a fiancée, I can search an area and explore nearby vendors.

- *Suggestion:* we create an “Explore” tab in a bottom panel navigation, which has the following:
 - A search bar that auto-populates at the city level
 - A colloquial triangle/arrow icon, which allows a user to set their current location
 - A google maps-esque UI across the page, which can be zoomed in/out based on finger or mouse dragging
 - An overlay of vendor “pins” in the area being rendered on the map, with different colors and icons for each type of vendor (venue = building, food = food, photos = camera, dresses = dress, planner = woman, flowers = flowers, Other = arrow?)

See mockup below for a rough *idea*:

As a fiancée, I can select vendors of interest and view both basic information and local intel about the vendor.

- **Suggestion:** if I click on one of the pins on the map, I get a vendor-specific page with the following:
 - Name of the vendor
 - Address of the vendor
 - Carousel of photos from Google Photos if applicable
 - A list of Recon entries, which should contain
 - Anonymous username
 - Price quotes + price details
 - Recon notes
 - Type of recon (online research, call/video meeting, in person visit)

- Image/video attachments (photos, videos, flyers, etc)

See mockup below for a rough *idea*:

As a fiancée, I can add a vendor of interest to my Planning Hub.

- *Suggestion:* in the vendor-specific page above, add a “plus” icon in the top right that saves the vendor to the Planning Hub

As a fiancée, I can share a vendor of interest with someone else, even if they don’t have an account on Planning Hub.

- *Suggestion:* in the vendor-specific page above, add a “share” arrow icon in the top right that allows the user to select a platform to share on (e.g. SMS, email etc - the native sharing experience) with the following pre-populated message: “Check out this {{vendor type}} vendor on Wedding Recon! {{deeplink to sign up page/vendor page}}”

Recon Creation

As a fiancée, I can create my own Recon entry very easily.

- *Suggestion:* we make the “PLUS” icon the central tab in the bottom navigation bar, which opens a form with the following fields:
 - Name of Vendor

- We should look for existing google businesses and show name + addresses in a dropdown to select a match. If there is no match, we should allow them to enter a name and address (address can be as generic as city), which we will then store as a valid record in the future for others to select.
- Type of vendor: Venue, Music, Planner, Flowers, Photos, Other
- Type of recon: online, virtual call/meeting, in-person
- Price: free text for relevant formatting (e.g. "\$100-\$150 per hour")
- Price details: free larger text for relevant nuance (e.g. "just the indoor venue is \$10k, but if you add the outdoor space then it's \$15k")
- Recon notes: large text box for general notes/review of the vendor (e.g. "The food tasting was awesome. We loved the appetizers but were less impressed with the main course")
- CTA to "Save" recon, which publishes it to the rest of the platform and adds it under the user's Planning Hub

See mockup below for a rough *idea*:

As a fiancée, I can create a Recon entry for an existing business on Google Maps or an unknown vendor.

As a fiancée, I can add details about the type of vendor, price information and other relevant details.

My Recon

As a fiancée, I can see all my vendors of interest and Recon in one place.

- *Suggestion:* we add a “Planning Hub” tab as the righthand tab in the bottom navigation, with:
 - a list of all vendors that the user has either a) added to their hub via the explorer, or b) added direct Recon for.
 - List should be sorted into accordion dropdowns based on vendor type (venues, flowers, etc.)
 - If the user has already added recon to that vendor, we note a pill saying “Recon added”. If they haven’t we provide a direct CTA that says “Add Recon”

See mockup below for a rough *idea*:

As a fiancée, I can easily add new Recon to a vendor I marked interest in.

- *Suggestion:* if the user clicks “Add Recon” above, we re-direct to the “Add Recon” page, with the vendor name pre-populated based on the original record they selected.
